

SEO Audit Report

azimkhan.in

64/100

On-page technical health score

Prepared for the owner of azimkhan.in

Date: 11 July 2026

Prepared by: SEO Audit

Executive Summary

This report reviews the search-engine health of **azimkhan.in** and explains, in plain language, what is helping the website rank in Google, what is holding it back, and exactly what to do next. Each finding includes the issue, why it matters to your business, and the recommended action.

64 Health score	1 High-priority fixes	6 Total issues	7 Checks passed
---------------------------	---------------------------------	--------------------------	---------------------------

What this means for you

Your website has a solid technical foundation, but a few important issues are limiting how well it can rank and how it appears in search results. The good news: every issue below is fixable, and the 1 high-priority items can be addressed quickly for the biggest gains.

Priority Action Plan

Priority	Action	Impact	Effort
High	www and non-www both live	High	Low
Medium	Homepage title length	Medium	Low
Medium	Homepage has two addresses	Medium	Low
Low	Meta description length	Low	Low
Low	Social share preview (Twitter/X)	Low	Low
Low	Structured data coverage	Low	Medium

Detailed Findings & Recommendations

Findings are ordered by priority. Each one is written so anyone can understand it — no technical background needed.

1. www and non-www both live

HIGH

THE ISSUE	Your site loads at both www.azimkhan.in and azimkhan.in without one redirecting to the other. Google sees these as two separate websites showing the same content.
WHY IT MATTERS	Duplicate versions split your ranking signals (links, authority) between two addresses instead of concentrating them on one, weakening your overall ranking power.
WHAT TO DO	Add a permanent 301 redirect from the www version to your preferred address (or vice-versa) via your host's settings or an .htaccess rule, so every visitor and search engine lands on one canonical version.

2. Homepage title length

MEDIUM

THE ISSUE	Your homepage title is 94 characters ("Marklo Digital Agency — Digital Marketing for Jewellery, Food & Coachi..."). Google typically shows only ~60 characters, so the end gets cut off.
WHY IT MATTERS	A truncated title looks unfinished in search results and can bury your most important keywords past the cut-off point.
WHAT TO DO	Trim the title to ~55–60 characters, keeping the strongest keyword and your brand at the front, e.g. "Digital Marketing Agency Kolkata Marklo".

3. Homepage has two addresses

MEDIUM

THE ISSUE	Your homepage opens at both azimkhan.in/ and azimkhan.in/index.html , and the site points its canonical tag at /index.html rather than the clean root address.
WHY IT MATTERS	Two URLs for the same page can dilute ranking signals, and the /index.html address is less clean to share and link to than the root.
WHAT TO DO	Redirect /index.html to / (301) and update the canonical tag, sitemap, and og:url to use the clean root address https://azimkhan.in/ .

4. Meta description length

LOW

THE ISSUE	The homepage meta description is 163 characters — beyond the ~155–160 Google usually displays.
WHY IT MATTERS	The tail of your description gets cut off in search results, so a call-to-action at the end may never be seen.
WHAT TO DO	Shorten the description to ~150 characters and put the key hook and call-to-action early.

5. Social share preview (Twitter/X)

LOW

THE ISSUE	Your pages include Facebook/LinkedIn share tags (Open Graph) but no Twitter Card tags.
WHY IT MATTERS	Without Twitter Card tags, links shared on X/Twitter may show a plain, less-clickable preview instead of a rich image card.
WHAT TO DO	Add twitter:card, twitter:title, twitter:description and twitter:image meta tags to the page head (they can mirror your Open Graph values).

6. Structured data coverage

LOW

THE ISSUE	Structured data (schema) is present on the homepage but is thin or absent on inner pages like services, about and contact.
WHY IT MATTERS	Richer, page-appropriate schema (Service, Organization, Breadcrumb, FAQ) helps Google understand each page and can unlock rich results.
WHAT TO DO	Add relevant schema to each page — e.g. Service schema on the services page, BreadcrumbList sitewide, and FAQ schema where you answer common questions.

What's Already Working Well

- ✓ The site tells Google its preferred web address (avoids duplicate-content issues).
- ✓ The site is set up to display correctly on mobile phones.
- ✓ Clear main heading in place.
- ✓ Images generally include descriptive text.
- ✓ Secure HTTPS is enforced (visitors are always sent to the secure version).
- ✓ Broken links correctly return a 404 (no misleading pages).
- ✓ An XML sitemap is published so Google can discover your pages.

Scope & Next Steps

This report covers **on-page and technical SEO**, assessed using live data read directly from your website. A complementary **market data** report — covering the keywords you rank for, estimated monthly traffic, your top competitors, and your backlink profile — is available as an add-on once data-provider access is connected.

Recommended order of work:

- › Fix the high-priority items first (title, conflicting tags, blocked pages) — quick changes, biggest impact.
- › Tidy the homepage heading and image descriptions.
- › Run a page-speed pass and optimise images.
- › Re-audit in 4–6 weeks to confirm improvements and track ranking gains.
