

SEO Audit Report

luxeclay.in

50/100

On-page technical health score

Prepared for the owner of luxeclay.in

Date: 25 June 2026

Prepared by: Your SEO Consultant

Executive Summary

This report reviews the search-engine health of **luxeclay.in** and explains, in plain language, what is helping the website rank in Google, what is holding it back, and exactly what to do next. Each finding includes the issue, why it matters to your business, and the recommended action.

50 Health score	3 High-priority fixes	5 Total issues	5 Checks passed
---------------------------	---------------------------------	--------------------------	---------------------------

What this means for you

Your website has a solid technical foundation, but a few important issues are limiting how well it can rank and how it appears in search results. The good news: every issue below is fixable, and the 3 high-priority items can be addressed quickly for the biggest gains.

Priority Action Plan

Priority	Action	Impact	Effort
High	Homepage title	High	Low
High	Conflicting SEO tags	High	Low
High	Important pages blocked from Google	High	Low
Medium	Page headings	Medium	Low
Medium	Page speed	Medium	Medium

Detailed Findings & Recommendations

Findings are ordered by priority. Each one is written so anyone can understand it — no technical background needed.

1. Homepage title

HIGH

THE ISSUE	Your homepage's title tag currently reads “Home - luxeclay” — only 15 characters and missing your main keywords.
WHY IT MATTERS	The title is the clickable blue headline shown in Google search results and the strongest single on-page ranking signal. A generic title means fewer people find and click your store.
WHAT TO DO	Set a descriptive, keyword-rich title such as “Handmade Clay Jewellery India LuxeClay – Earrings, Studs & Pendants” (≈55–60 characters) in your SEO plugin settings.

2. Conflicting SEO tags

HIGH

THE ISSUE	The homepage is sending Google the same information twice (and the social-share title three times). This happens when two tools — your SEO plugin and your theme — both try to control SEO settings.
WHY IT MATTERS	When search engines receive conflicting instructions they may pick the wrong description or social preview, hurting how your brand appears in search and on WhatsApp/Instagram shares.
WHAT TO DO	Choose one tool (Yoast SEO is already installed) to manage SEO and social tags, and switch off the duplicate output in the theme or the second plugin.

3. Important pages blocked from Google

HIGH

THE ISSUE	Key shop pages (/product-category/all-products/, /shop/) are listed in your sitemap as pages you want indexed, but your robots.txt file simultaneously tells Google not to visit them.
WHY IT MATTERS	This contradiction can keep your main shop and category pages out of Google entirely — exactly the pages that should be earning sales traffic. It also wastes Google's crawl budget on a dead end.
WHAT TO DO	Decide that the shop pages should rank (recommended for a store) and remove the matching “Disallow” lines from robots.txt so Google can crawl and index them.

4. Page headings

MEDIUM

THE ISSUE	The homepage has 2 main headings (“FLASH SALE !!” and “HANDCRAFTED, JUST FOR YOU.”). Best practice is a single main heading that states what the page is about.
WHY IT MATTERS	The main heading helps Google understand the page's topic. A promotional banner heading like a flash-sale line doesn't describe your products and dilutes that signal.
WHAT TO DO	Use one clear main heading describing the business (e.g. “Handmade Clay Jewellery, Crafted in India”) and make promotional lines sub-headings instead.

5. Page speed

MEDIUM

THE ISSUE	The homepage is heavy to load (about 701 KB of code before images are counted).
WHY IT MATTERS	Slow pages frustrate shoppers and lower mobile rankings. Most of your visitors are likely on phones, where speed matters most for sales.
WHAT TO DO	Compress and lazy-load images, and review the page builder for unused elements. Run a Google PageSpeed Insights test and target the flagged items.

What's Already Working Well

- ✓ A search-result description is in place.
- ✓ The site tells Google its preferred web address (avoids duplicate-content issues).
- ✓ The site is set up to display correctly on mobile phones.
- ✓ Images generally include descriptive text.
- ✓ Secure HTTPS is enforced across the site.
- ✓ Web and non-web addresses are correctly unified (no duplicate versions).
- ✓ An XML sitemap is published so Google can discover your pages.

Scope & Next Steps

This report covers **on-page and technical SEO**, assessed using live data read directly from your website. A complementary **market data** report — covering the keywords you rank for, estimated monthly traffic, your top competitors, and your backlink profile — is available as an add-on once data-provider access is connected.

Recommended order of work:

- › Fix the high-priority items first (title, conflicting tags, blocked pages) — quick changes, biggest impact.
- › Tidy the homepage heading and image descriptions.
- › Run a page-speed pass and optimise images.
- › Re-audit in 4–6 weeks to confirm improvements and track ranking gains.
